

Newer medications used in the treatment of COVID19

Sr No	Name	Use
1)	Remdisivir	Remdesivir is an investigational drug being studied to treat coronavirus infection, also known as COVID-19.
2)	Dexamethasone	Dexamethasone is a corticosteroid used in a wide range of conditions for its anti-inflammatory and immunosuppressant effects.
3)	Convalescent plasma	Multiple studies have now reported the use of COVID-19 convalescent plasma (CCP) to treat COVID-19 patients, without unexpected or serious adverse events
4)	Azithromycin	Azithromycin is an antibiotic commonly used to treat bacterial infections such as bronchitis and pneumonia.
5)	Tocilizumab	Tocilizumab is an IL-6 inhibitor approved for rheumatoid arthritis and juvenile idiopathic arthritis. (Both are inflammatory diseases).Tocilizumab has found to be effective in the treatment of patients with severe COVID-19.

6)	Monoclonal antibodies (MABs)	Researchers are optimistic that monoclonal antibodies could help prevent and treat early infections of Covid-19 too. They can specifically target the SARS-CoV-2 virus because they can provide rapid protection against infection – once administered, monoclonal antibodies enter the bloodstream straight away and offer immediate protection for a few weeks or months. they originate in the blood of people who have recovered from Covid-19; this would potentially make them more effective than other drugs.
7)	Chloroquine	Chloroquine is a drug that's used to fight malaria and autoimmune diseases. At the beginning of the pandemic, researchers discovered that the drug effectively fought SARS-COV2 virus
8)	Limcee (Vitamin C)	Antimicrobial, anti-inflammatory and antioxidant effects. Antibody production, reduction of respiratory tract and lung infection risk
9)	Multi- Vitamin	Support of the cells and tissues and immune system overall
